Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application:

1. (currently amended) An intraocular lens assembly for increased depth of focus, comprising: a frame having haptics extending oppositely and longitudinally, said haptics having lateral edges disposed on an outer periphery of the frame, said frame being configured to rigidly vault posteriorly in an eye of a person, said frame having end portions to engage in the periphery of the capsular bag of an eye, said frame defining an opening disposed through said frame, said opening positioned between inner portions of said haptics, an optic sized and ~~configured~~ configured to engage in an edge portion of said frame opening, and interengaging features on the frame and on the optic for attachment of the optic to the frame for limited anterior optic movement relative to the frame, whereby light refracted by the cornea of the eye travels in an increased distance to the optic to substantially increase depth of focus.

2. (original) An assembly according to claim 1, wherein: said optic has a thickness substantially less than the thickness of a natural human lens.

3. (original) An assembly according to claim 1, wherein the optic is about 1.0 mm in thickness.

4. (original) An assembly according to claim 1, wherein the optic has a thickness between 0.5 mm and 1.5 mm.

5. (original) An assembly according to claim 1, wherein: said interengaging features comprise transverse slots in the frame spaced oppositely from said opening, and mounting portions extending oppositely from the optic and having transverse ridges at end portions thereof for retention in the slots.

Examiner	:	David H. Willse
Docket No.	:	13533.4074

6. (original) An assembly according to claim 5, wherein at least one of said slots has a widened portion with slot end shoulders to retain at least one of said ridges for prevention of optic lateral movement.

7. (original) An assembly according to claim 6, wherein each of said slots has a widened portion with end shoulders to retain the optic against lateral movement.

8. (original) An assembly according to claim 1, and further including: an edge portion of the frame about said frame opening extending posteriorly to engage the optic farther posteriorly.

9. (original) An intraocular lens assembly according to claim 1, wherein the frame is formed of a generally rigid material and the optic is formed of a flexible optical material.

10. (currently amended) An intraocular lens assembly for increased depth of focus, comprising: a frame of generally rigid material and ~~configured~~ configured to vault posteriorly in an eye of a person, said frame having haptics extending oppositely and longitudinally, said haptics having lateral edges disposed on the outer periphery of the frame, said frame defining a central opening disposed through said frame, said frame having transverse slots spaced oppositely from said frame opening, and an optic adapted to be disposed adjacent said frame opening, said optic having mounting portions extending oppositely therefrom for engagement in said frame slots to retain the optic relative to the frame but allow anterior movement of the optic relative to the frame, whereby light refracted by the cornea of the eye travels in an increased distance to the optic to substantially increase depth of focus.

11. (original) An assembly according to claim 10, wherein: said optic has a thickness substantially less than the thickness of a natural human lens.

Applicant	:	J. Stuart Cumming
Appl. No.	:	09/574,441
Examiner	:	David H. Willse
Docket No.	:	13533.4074

12. (original) An assembly according to claim 11, wherein the optic is about 1.0 mm in thickness.

13. (original) An assembly according to claim 11, wherein the optic has a thickness between 0.5 mm and 1.5 mm.

14. (original) An assembly according to claim 10, wherein said optic mounting portions extending oppositely from the optic have transverse ridges at end portions thereof for retention in the slots.

15. (original) An assembly according to claim 14, wherein at least one of said slots has a widened portion with end shoulders to retain at least one of said ridges to retain the optic in position.

16. (original) An assembly according to claim 14, wherein each of said slots has a widened portion with end shoulders to retain the optic against lateral movement.

17. (original) An assembly according to claim 10, and further including: an edge portion of the frame adjacent to said frame opening extending posteriorly to engage the optic farther posteriorly.

18. (original) An assembly according to claim 10, wherein: a loop portion extends from an outer end portion of each haptic and transversely of the lens assembly to engage peripheral portions of the capsular bag.

19. (original) An assembly according to claim 10, wherein said mounting portions of the optic comprise ridges, and at least one of said ridges has a passage therethrough to facilitate insertion and engagement of the optic mounting portion in at least one of the slots.

20. (original) An apparatus according to claim 19, wherein each of the

oppositely extending mounting portions has a passage therethrough.

21. (original) An intraocular lens assembly according to any one of claim 1, or 10, wherein the optic is formed of a flexible optical material.

22. (currently amended) An intraocular lens assembly for increased depth of focus, comprising: a frame having haptics extending oppositely and longitudinally, said haptics having lateral edges disposed on an outer periphery of the frame, said frame being ~~configured~~ configured to vault posteriorly in an eye of a person, said frame having end portions to engage in the periphery of the capsular bag of an eye, said frame defining a generally circular opening disposed through said frame, said opening positioned between inner portions of said haptics, an optic sized and ~~configured~~ configured to engage in an edge portion of said frame opening, and interengaging features on the frame and on the optic for attachment of the optic to the frame for limited optic movement relative to the frame, said interengaging features comprising transverse slots in the frame spaced oppositely from said opening, and mounting portions extending oppositely from the optic and having transverse ridges at end portions thereof for retention in the slots, at least one of said slots having a widened portion with slot end shoulders to retain at least one of said ridges for prevention of optic lateral movement, and a notch extending from at least one of said slots adjacent to said frame opening to facilitate folding of the frame for insertion thereof through a slit in an eye, whereby light refracted by the cornea of the eye travels an increased distance to the optic to substantially increase depth of focus.

23. (currently amended) An intraocular lens assembly for increased depth of focus, comprising: a frame having haptics extending oppositely and longitudinally, said haptics having lateral edges disposed on an outer periphery of the frame, said frame being ~~configured~~ configured to vault posteriorly in an eye of a person, said frame defining a generally circular opening disposed through said frame, said

Docket No.	:	13533.4074

opening positioned between inner portions of said haptics, an optic sized and ~~configured~~ configured to engage in an edge portion of said frame opening, and interengaging features on the frame and on the optic for attachment of the optic to the frame for limited optic movement relative to the frame, and wherein the frame has folding portions formed of a relatively soft material to provide for folding of the frame for insertion into an eye, whereby light refracted by the cornea of the eye travels an increased distance to the optic to substantially increase depth of focus.

24. (currently amended) An intraocular lens assembly for increased depth of focus, comprising: a frame of generally rigid material and ~~configured~~ configured to vault posteriorly in an eye of a person, said frame having haptics extending oppositely and longitudinally, said haptics having lateral edges disposed on an outer periphery of the frame, said frame defining a central generally circular opening disposed through said frame, said frame having transverse slots spaced oppositely from said frame opening, and an optic adapted to be disposed adjacent said frame opening, said optic having mounting portions extending oppositely therefrom for engagement in said frame slots to retain the optic relative to the frame, and wherein the frame has folding portions formed of a relatively soft material to provide for folding of the frame for insertion into an eye, whereby light refracted by the cornea of the eye travels an increased distance to the optic to substantially increase depth of focus.

25. (original) An intraocular lens assembly for increased depth of focus, comprising: a posteriorly vaulted longitudinally rigid frame adapted for engagement with the periphery of a capsular bag of an eye, said frame having flexible tangential end portions extending oppositely to engage in a peripheral portion of the capsular bag, and an optic comprising a flexible optic disposed in an opening in the frame and having attachments for allowing movement of the optic relative to the frame, and the lens assembly being constructed to be foldable longitudinally.

26. (original) An intraocular lens assembly for increased depth of focus, comprising: a posteriorly vaulted rigid frame for implantation in a capsular bag of an eye and adapted for engagement with the periphery of a capsular bag of an eye, said frame having end portions extending oppositely to engage in a peripheral portion of the capsular bag, said frame having haptics extending oppositely and longitudinally, and the frame having an opening therethrough between inner portions of the haptics, and an optic comprising a flexible optic and attachments for allowing movement of the optic relative to the frame, the optic being configured to engage in an edge portion of the frame opening, and the lens assembly being constructed to be foldable longitudinally.

27. (previously presented) An intraocular lens assembly for increased depth of focus, comprising: a posteriorly vaulted relatively rigid frame for implantation in a capsular bag of an eye and adapted for engagement with the periphery of a capsular bag of an eye, said frame having end portions extending oppositely to engage in a peripheral portion of the capsular bag, said frame having haptics extending oppositely and longitudinally, and the frame having an opening therethrough between inner portions of the haptics, and an optic comprising a flexible optic and attachments for allowing movement of the optic relative to the frame, the optic being configured to engage in an edge portion of the frame opening, and the lens assembly being constructed to be foldable.
